Challenges in VR Testing

- SOTA tools (VRTest[1], VRGuide[2]) fail to fully support diverse VR interactions (e.g., grab, press, shoot).
- Vast exploration space due to complex 3D environments and object interactions.
- Task sequences with interdependent actions (e.g., find key → unlock door → turn handle → press button).

Approach

- Project Collection & Static/Dynamic Analysis**
- Model Abstraction:** Generalizes objects and actions into abstract models.
- EAT Framework:** Three-layer design—Entity, Action, and Task (sequential/parallel composition).
- Testing Process:** Performing task-based interaction testing via NavMesh navigation & PFMS.

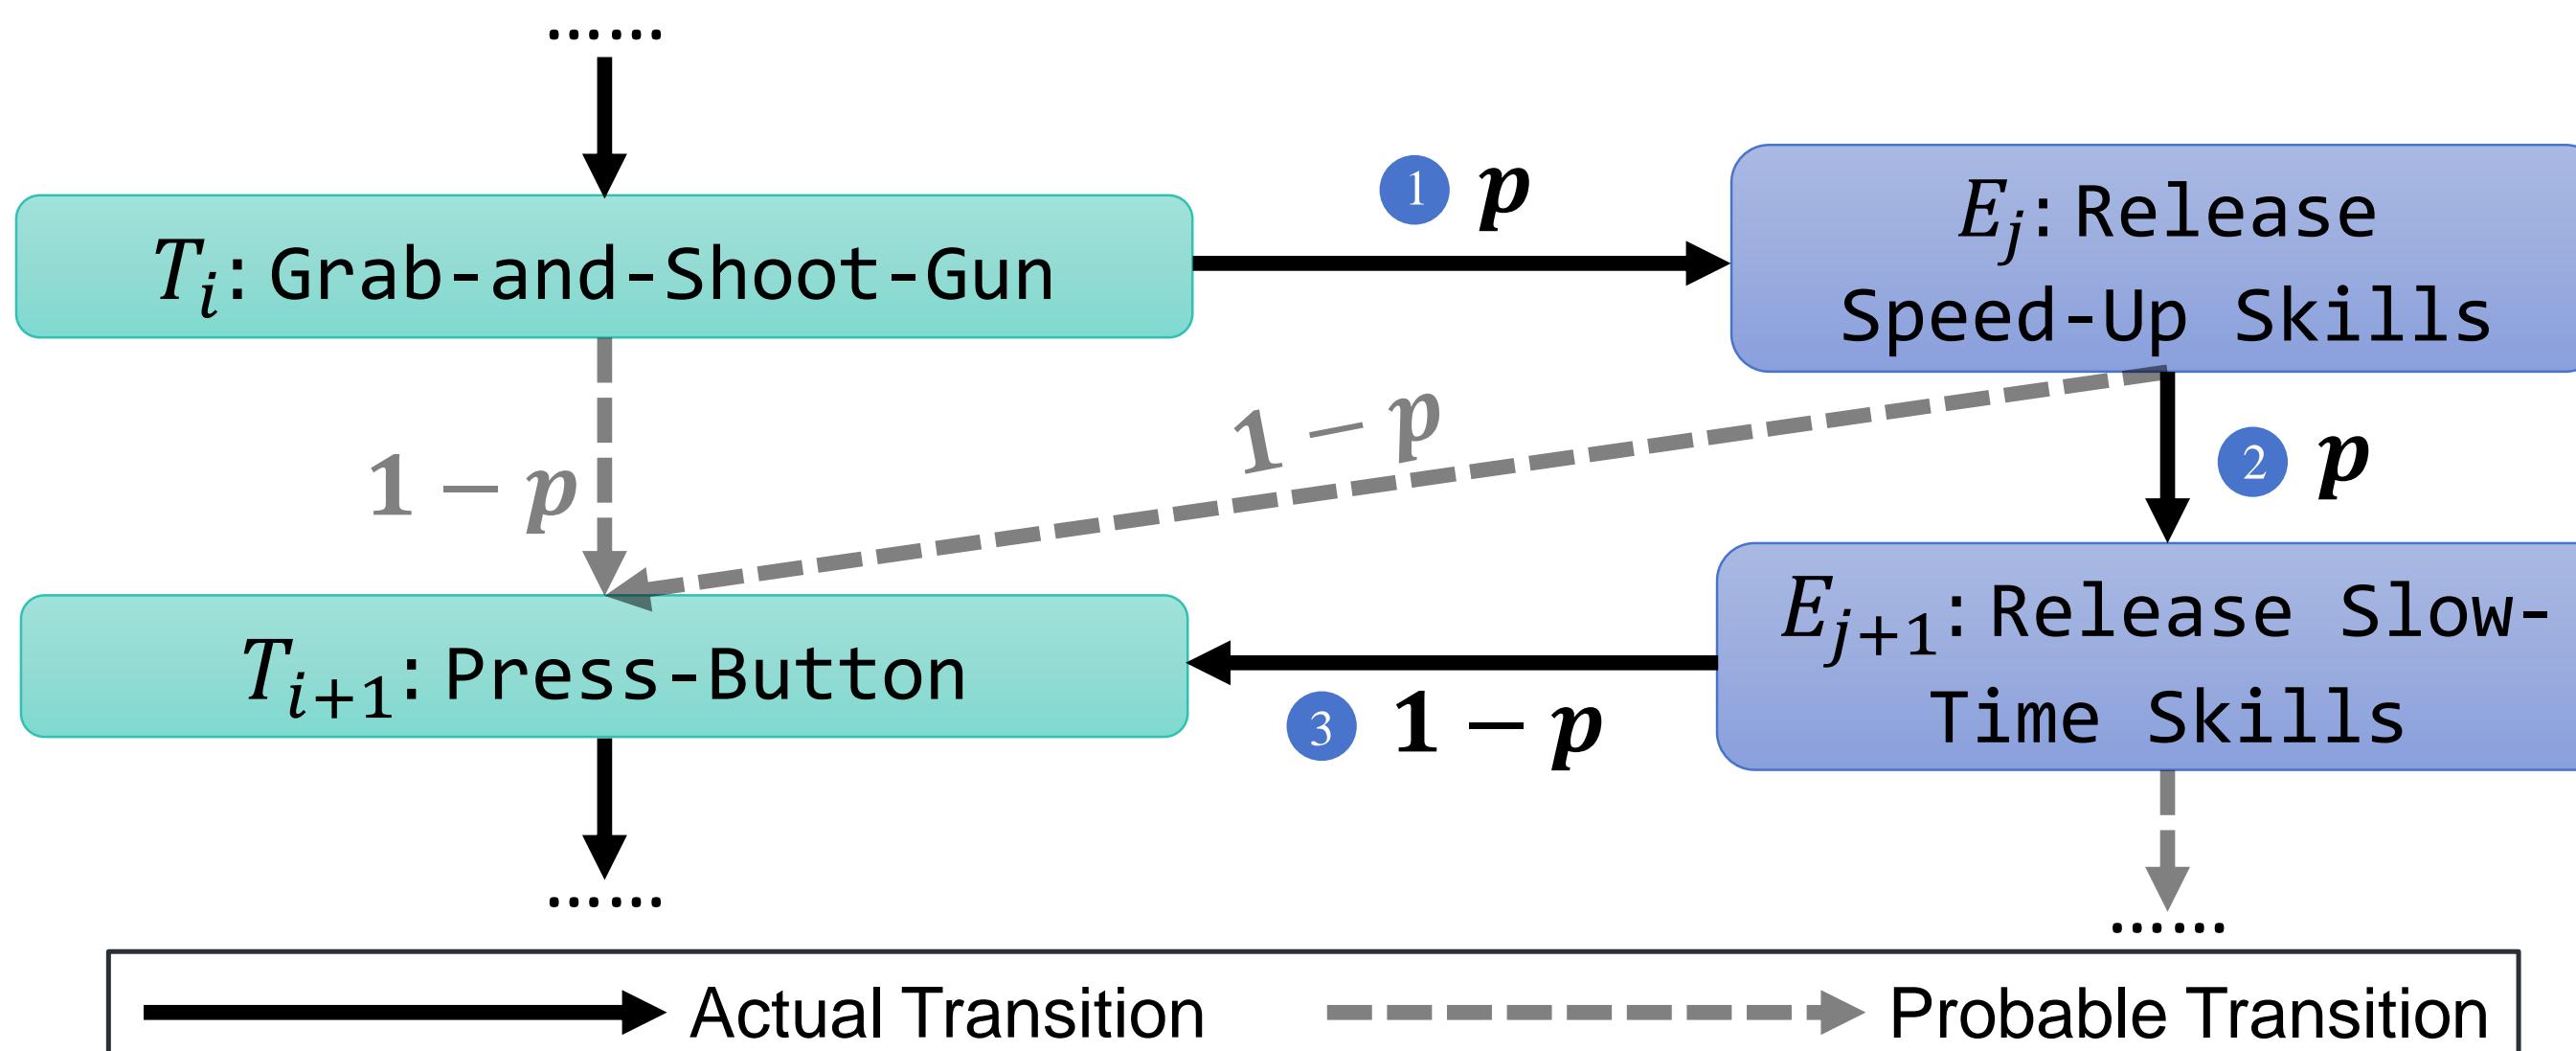

Figure: Example of PFSM State Transition in a VR Scene.

Experiment Results

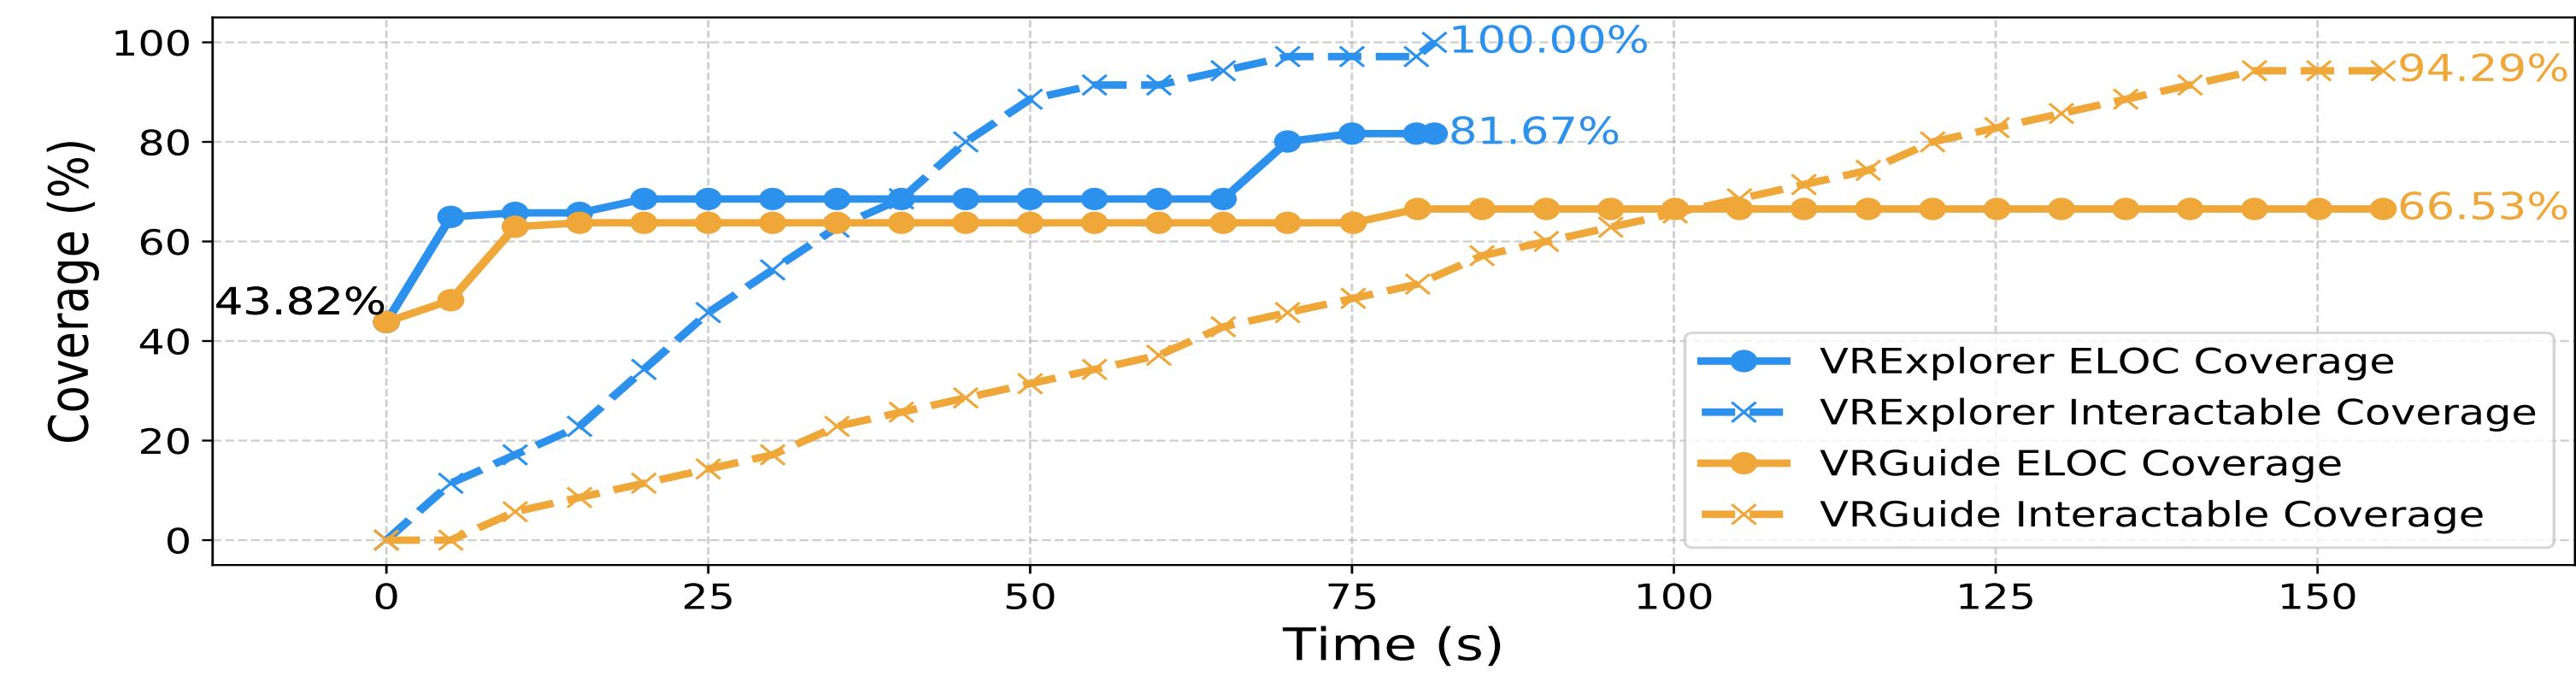

Figure: Coverage versus Time in A Project

- Performance:** Average gains of +122.8% EC and +52.8% MC vs SOTA on 11 Projects
- Real Bug Detection:** Found 3 real-world bugs (2 functional, 1 non-functional)
- Faster Convergence:** Achieves higher coverage with reduced time cost

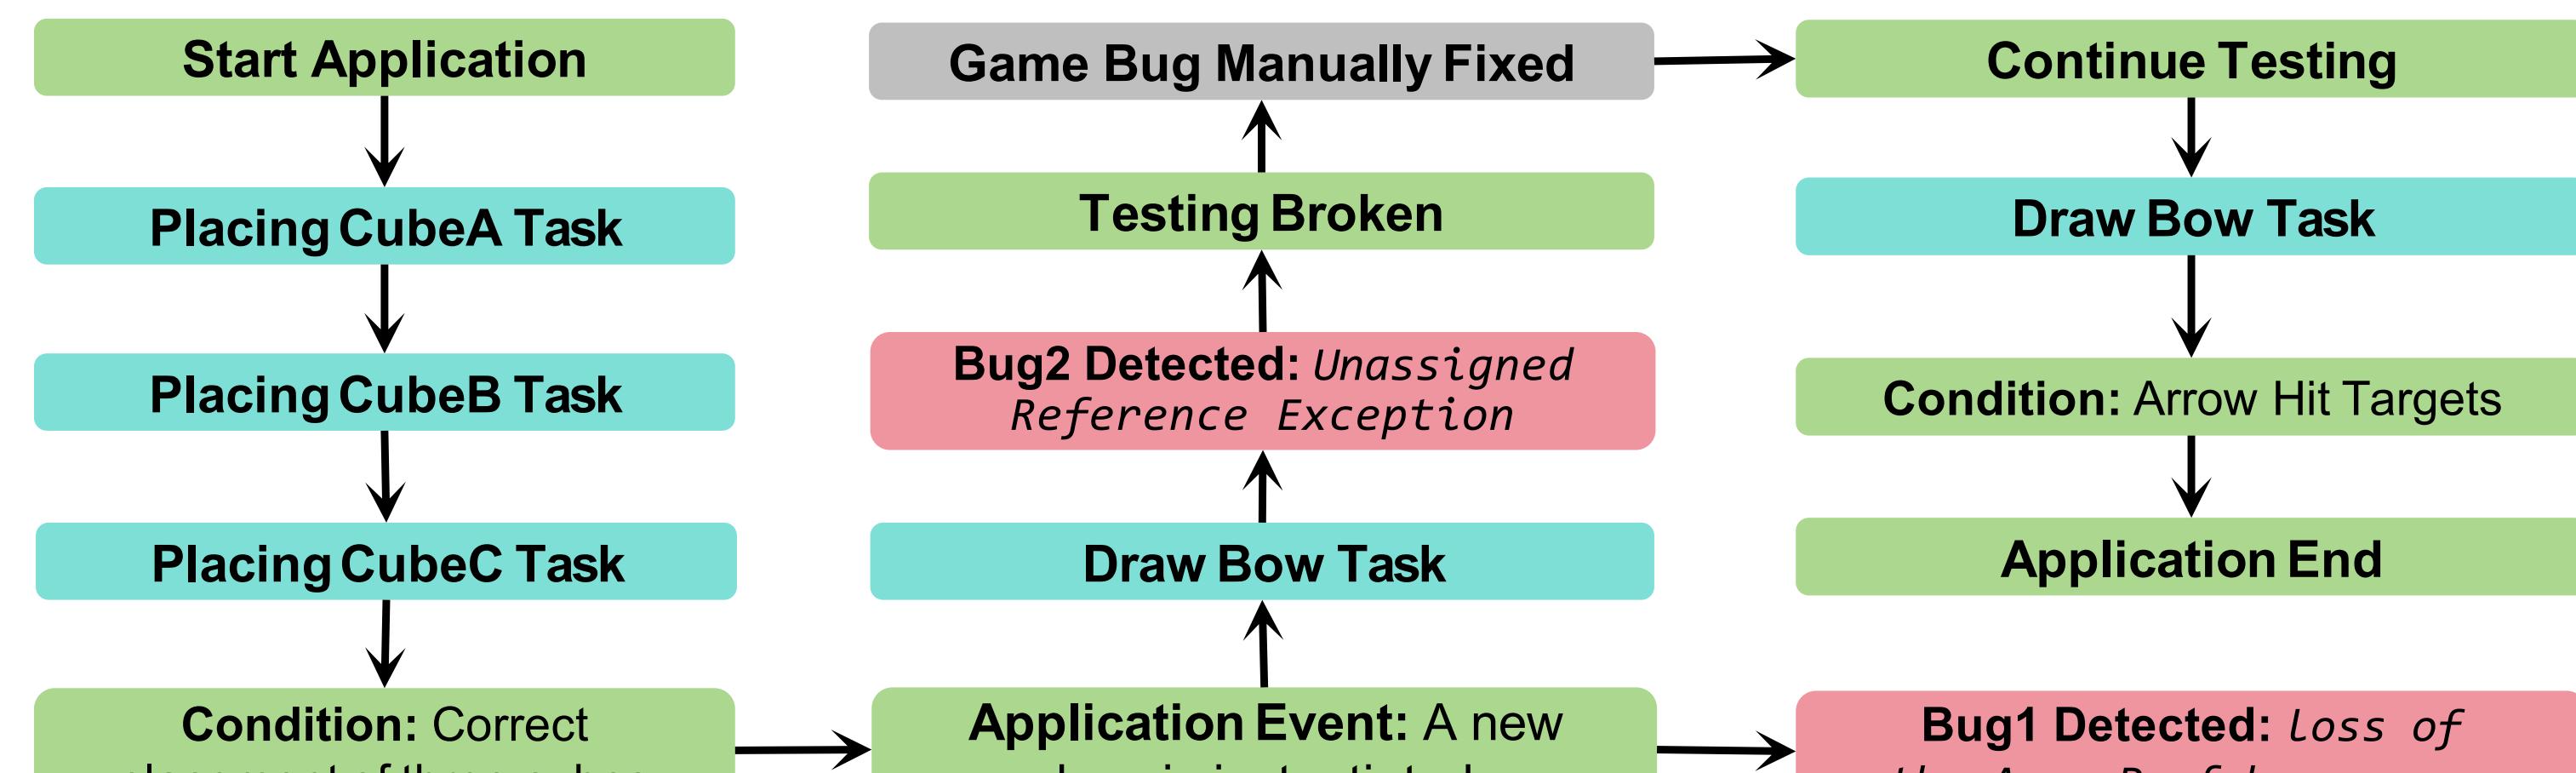

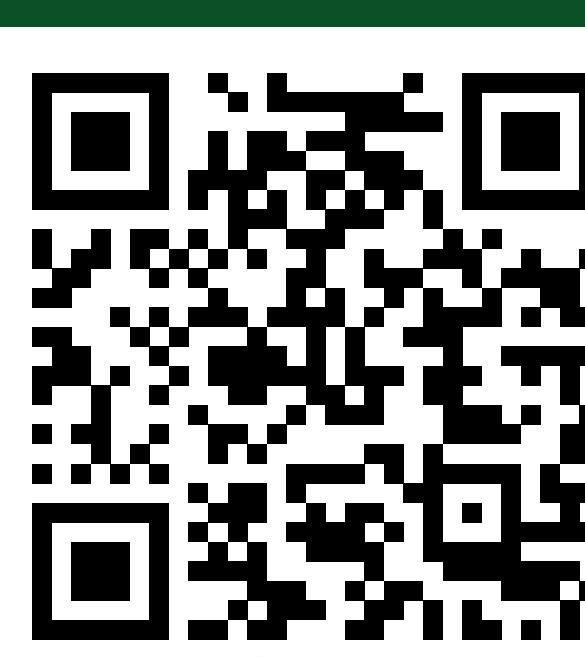

Figure: Example of how VRExplorer explores scenes and detects bugs
